---

**Learning objectives**

Define multilevel study.

Recognize a multilevel study.

Describe the advantages of a multilevel study.

2

---

---

---

---

---

---

---

---

**Learning objectives**

Recognize that some authors use the terms group- or cluster-randomized trial or observational cluster or hierarchal study, rather than using the level terminology.

Describe how multilevel studies induce correlation.

3

---

---

---

---

---

---

---

---

**A multilevel study involves one or more hierarchical groups of observations**

Authors use different but equivalent terminology.

Examples:

- “Two-level study”
- “Two-level group design”
- “Two-level cluster design”
- “Two-level hierarchal design”

4

---

---

---

---

---

---

---

---

**Members of a level, also referred to as a group or cluster, share experiences which induce correlation**

Multilevel studies involve two or more layers of correlation.

Murray, D. M., 1998

5

---

---

---

---

---

---

---

---

**For example, reading scores from students in the same school are correlated**

Shared teacher → induces a correlation

Shared school → induces a correlation

**Two level design**

Schools	ISU
Classrooms	Level 1
Students	Level 2

Murray, D. M., 1998

6

---

---

---

---

**We examine an example of a multilevel, randomized controlled trial**

A **randomized controlled trial** is a study in which participants are randomized into either a study group which receives an intervention or a control group which does not.

May have more than two groups.

It is sometimes better, and sometimes necessary, to randomize two or more participants at a time, i.e., randomize clusters of participants

p.139, Last JM, 2000

---

---

---

**The study assessed the effectiveness of a literacy intervention**

**Vignette**

Researchers conducted a cluster randomized control trial to evaluate the effectiveness of a web-based literacy intervention called ABRACADABRA (ABRA).

Adapted from Piquette, et al., 2014

8

---

---

---

---

---

---

---

---

---

---

**The study assessed the effectiveness of a literacy intervention**

**Vignette, continued**

The study included 24 classrooms within 12 elementary schools within a single school district. Researchers assumed that schools within the district were under local control and were therefore independent.

Adapted from Piquette, et al., 2014

9

---

---

---

---

---

---

---

---

---

---

**The study assessed the effectiveness of a literacy intervention**

**Vignette, continued**

Schools were randomized into the intervention group or the control group. Change in literacy was evaluated using pre- and post-tests to determine whether ABRA technology significantly improved literacy in elementary school children.

Adapted from Piquette, et al., 2014

10

---

---

---

---

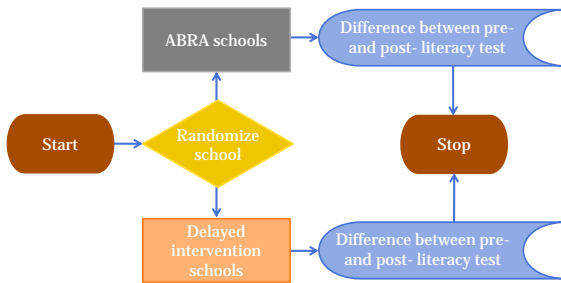

---

---

---

---

**Randomization of study conditions took place at the school level**

Adapted from Piquette, et al., 2014

11

---

---

---

---

---

---

---

---

**The goal of the study was to assess the effectiveness of a literacy intervention**

**Null hypothesis:**

There is no significant difference in literacy between elementary students in the intervention group and those in the control group.

Adapted from Piquette, et al., 2014

12

---

---

---

---

---

---

---

---

**Researchers adjusted for correlation to isolate the impact of the intervention**

Several sampling features of the design created correlations.

Classrooms within schools are correlated.

Students within each classroom are correlated.

Failure to adjust for correlation would inflate Type I error rate.

Adapted from Piquette, et al., 2014

13

---

---

---

---

---

---

---

---

**Change in literacy scores was chosen as the measure of intervention effectiveness**

Independent sampling unit:

School

Unit of observation:

Difference between pre- and post-test performance

Adapted from Piquette, et al., 2014

14

---

---

---

---

---

---

---

---

**The goal of the study was to assess the effectiveness of a literacy intervention**

Between-independent sampling unit factor:

Randomization group (scientific focus)

Within-independent sampling unit factor:

Cluster member

No scientific interest in within factor here.  
Within factor is interesting in other settings.

Adapted from Piquette, et al., 2014

15

---

---

---

---

---

---

---

---

**ABRACADABRA was associated with greater improvements in early literacy**

By accounting for existing organizational groups, the **multilevel design** enabled researchers to isolate the ABRACADABRA program as the primary cause of literacy improvement.

Adapted from Piquette, et al., 2014

16

---

---

---

---

---

---

---

---

---

**Review Summary**

- **Multilevel studies** have more than one hierarchical level, inducing **multiple layers of correlation** (ex. students within classrooms, classrooms within schools)
- We account for the multiple hierarchical levels and the correlation induced, which is a result of the shared experiences within these levels
- Accounting for correlation allows us to isolate factors being explored as primary causes of outcomes we find
